Dear Hiring Manager,

I am writing to express my interest in the **Software Engineer (C++)** position at Bentley. With over five years of experience at Hatch spanning software development, commissioning, and mechanical engineering, I have built industrial software that directly supports the design, operation, and optimization of large-scale infrastructure projects. Bentley's mission of advancing the world's infrastructure through engineering software strongly resonates with my professional background and interests.

Throughout my career, I have enjoyed working at the intersection of engineering and software. At Hatch, I co-developed **VISTA**, a real-time hydroelectric plant operating platform written in **C++** and **C#**, where I contributed to data processing modules, maintained a legacy C++ codebase, and participated in modernizing the system by replacing outdated Oracle container libraries with the C++ Standard Library. Working within an Azure DevOps environment taught me the importance of writing maintainable, well-tested software while collaborating closely with multidisciplinary engineering teams.

Beyond desktop application development, I have built distributed systems for industrial environments. I developed a computer vision platform for mining operations using Python, PyTorch, Flask, and Angular, deploying machine learning models to edge devices for real-time safety monitoring. This experience strengthened my understanding of performance, networking, and building reliable systems that operate in demanding field environments.

My engineering background has also given me a unique perspective on the users of technical software. As a commissioning engineer and package engineer on major mining and processing projects, including the Jansen Potash Project, I worked directly with operations teams, contractors, and engineers to deliver practical solutions under real-world constraints.

Understanding both the engineering domain and the software that supports it allows me to build tools that solve meaningful problems for end users.

Outside of my professional work, I enjoy exploring systems programming through personal projects. I have developed a custom C++ HTTP framework and lightweight in-memory database to deepen my understanding of networking, concurrency, memory management, and software architecture. These projects reflect my genuine enthusiasm for modern C++ and my desire to continually improve as a software engineer.

I am excited by the opportunity to contribute to Bentley's engineering software products and work alongside a team dedicated to building high-quality solutions for infrastructure professionals around the world. I would welcome the opportunity to discuss how my combination of industrial engineering experience and software development expertise can contribute to Bentley's continued success.

Thank you for your time and consideration. I look forward to hearing from you. Sincerely, **Nebojsa Jovanovic**
